Topical Tretinoin (Retin-A®)

This sheet is about using topical tretinoin in pregnancy and while breastfeeding. This information should not take the place of medical care and advice from your healthcare provider.

**What is tretinoin?**

Topical tretinoin is a medication that is applied to the skin to treat acne, prevent wrinkles, and help with other skin problems. Some brand names for tretinoin include Atralin®, Avita®, Retin-A®, Renova®, Refissa® and Tretin-X®.

Tretinoin belongs to a group of medications called the retinoids. Retinoids are related to Vitamin A which is required, in small amounts, for typical development. Other medications in the retinoid family are isotretinoin (Accutane®, Claravis®), acitretin (Soriatane®) and adapalene (Differin®). MotherToBaby has a fact sheet on isotretinoin here: https://mothertobaby.org/fact-sheets/isotretinoin-accutane-pregnancy/.

Tretinoin is also available in an oral form (to take by mouth) for the treatment of leukemia. This sheet will discuss the topical (applied to skin) use of tretinoin.

**My healthcare provider said that tretinoin is like isotretinoin. I’ve heard that it should not be used during pregnancy.**

Much of the concern about tretinoin is because it is a related to isotretinoin, a medication known to cause birth defects involving the face, heart and brain. However, isotretinoin is taken by mouth, and easily enters a person’s bloodstream in relatively large amounts, and can then reach the developing baby.

When tretinoin is applied to the skin, lower levels pass through the skin and get into the bloodstream than with isotretinoin. Applying tretinoin to broken skin, using more than is needed on an area, or using it over a large area will cause more of the tretinoin to pass through the skin. In general, the less tretinoin that is used on the skin, the less likely there will be risks to the baby.

**I take tretinoin. Can it make it harder for me to get pregnant?**

It is not known if tretinoin can make it harder to become pregnant.

**I am using tretinoin, but I would like to stop using it before becoming pregnant. How long does it stay in my body?**

People eliminate medication at different rates. In healthy adults, it takes up to 1 day, on average, for most of the tretinoin to be gone from the body. The makers of oral isotretinoin suggest that females stop using isotretinoin one month before trying to get pregnant. Based on this suggestion for isotretinoin, it may be suggested to stop using tretinoin one month before trying to get pregnant. However, if you get pregnant by mistake during that month, the chances your use of tretinoin has harmed your baby are likely to be small.

**Does using topical tretinoin for acne increase the chance for miscarriage?**

Miscarriage can occur in any pregnancy. The topical use of tretinoin is not known to increase the chance for miscarriage.

**Does taking tretinoin increase the chance of birth defects?**

Every pregnancy starts out with a 3-5% chance of having a birth defect. This is called the background risk. Several studies have tried to learn if topical tretinoin use could harm a pregnancy. These studies have not found a greater chance for birth defects with proper application of tretinoin to the skin.

There have been reports of babies born with birth defects after people who are pregnant used tretinoin on their skin during pregnancy. Usually, a few reports do not cause healthcare providers to worry, but the birth defects reported in these cases are similar to the birth defects seen in babies exposed to isotretinoin during pregnancy. Since tretinoin and isotretinoin are related, it is possible that these two medications can affect the baby in the same way. Because many individuals have used tretinoin during pregnancy and have not had babies with a birth defect, the chance for
Topical Tretinoin (Retin-A®)

November 1, 2020

Birth defects is probably low. However, it is generally recommended not to use tretinoin in pregnancy.

**Could taking tretinoin cause other pregnancy complications?**

Some studies have not found a greater chance for preterm delivery (delivery before 37 weeks of pregnancy) with proper application of tretinoin to the skin.

**If I stop using tretinoin in the first trimester, is it okay to start using it again later in my pregnancy?**

During the first three months of pregnancy, the baby’s organs are forming. In months four through nine, the baby’s body and brain are growing. Tretinoin use in the second and third trimesters is less likely to cause a birth defect. However, until more information is available, avoiding this product throughout pregnancy may be the best course of action. For general information on the timing of exposures in pregnancy, see the MotherToBaby fact sheet on critical periods of development at [https://mothertobaby.org/fact-sheets/critical-periods-development/](https://mothertobaby.org/fact-sheets/critical-periods-development/).

**Does taking tretinoin in pregnancy cause long-term problems in behavior or learning for the baby?**

It is not known if tretinoin can cause learning or behavior issues.

**Can I breastfeed while taking tretinoin?**

Tretinoin use during breastfeeding has not been studied. However, when used on your skin, very little tretinoin passes into your body, and so the amount in breast milk would be expected to be small. Be sure to talk to your healthcare provider about all of your breastfeeding questions.

**I take tretinoin. Can it make it harder for me to get my partner pregnant or increase the chance of birth defects?**

There are no studies looking at possible risks to a pregnancy when the father or sperm donor is using tretinoin. In general, exposures that fathers or sperm donors have are unlikely to increase risks to a pregnancy. For more information, please see the MotherToBaby fact sheet Paternal Exposures at [https://mothertobaby.org/fact-sheets/paternal-exposures-pregnancy/](https://mothertobaby.org/fact-sheets/paternal-exposures-pregnancy/).
